

GIT CLASS 3

GIT BRANCHES:

- A branch represents an independent line of development.
- The git branch command lets you create, list, rename, and delete branches.
- The default branch name in Git is master.
- allows you to work on different features or changes to your code independently, without affecting the main or other branches.
- It's a way to organize and manage your code changes, making it easier to collaborate and maintain your project.

COMMANDS:

<code>git branch</code>	used to see the list of branches
<code>git branch branch-name</code>	to create a branch
<code>git checkout branch-name</code>	to switch one branch to another
<code>git checkout -b branch-name</code>	used to create and switch a branch at a time
<code>git branch -m old-branch new-branch</code>	used to rename a branch
<code>git branch -d branch-name</code>	to delete a branch
<code>git branch -D branch-name</code>	to delete a branch forcefully

The -d option will delete the branch only if it has already been pushed and merged with the remote branch. Use -D instead if you want to force the branch to be deleted, even if it hasn't been pushed or merged yet. The branch is now deleted locally.

Now all the things you have done is on your local system.

GIT MERGE:

Git merge is a command used in the Git version control system to combine changes from one branch.

To merge: `git merge branch_name`

GIT CHERRY-PICK:

Git cherry-pick is a command in Git that allows you to take a specific commit from one branch and apply it to another branch. It's like picking a cherry (commit) from one branch and adding it to another branch, allowing you to selectively copy individual commits without merging the entire branch.

Command: `git cherry-pick commit_id`

GIT STASH: Using the git stash command, developers can temporarily save changes made in the working directory. It allows them to quickly switch contexts when they are not quite ready to commit changes. And it allows them to more easily switch between branches.

Generally, the stash's meaning is "store something safely in a hidden place."

COMMANDS:

git stash	to delete the changes permanently
git stash save "message"	to save the stash along with the message
git stash apply	to get back the data again
git stash list	to get the list of stashes
git stash clear	to clear all stashes
git stash pop	to delete the first stash
git stash drop	used to delete the latest stash
git stash drop stash@{2}	used to delete a particular stash

INTERVIEW QUESTIONS:

- How do you get the changes from one branch to another branch
- How to create a branch
- How to delete a branch
- How to modify a branch
- How to revert someone's changes
- What is cherry-pick in GIT
